PROCESS FOR REMOVAL OF CATALYST RESIDUES FROM POLY-α-OLEFINS ABSTRACT OF THE DISCLOSURE

A method is disclosed for reducing levels of residual halogen and Group IIIb metals in a crude $poly(\alpha$ -olefin) polymerized in the presence of a catalyst comprising the halogen and Group IIIb metals, wherein the method comprises:

- A) washing the crude $poly(\alpha$ -olefin) with water;
- B) separating the aqueous and organic phases;
- C) then adding an adsorbent selected from the group consisting of magnesium silicates, calcium silicates, aluminum silicates, aluminum oxides, and clays to the organic phase to form a slurry;
 - D) heating the slurry under reduced pressure at a temperature of at least about 180° C for at least about thirty minutes; and then
 - E) separating the adsorbent from the slurry.
